

Bug report for Youtube testing

I have tested the basic functionality of youtube from a normal user perspective : such as video playing , pause , comment , share , likes , subscribe which is the core function of Youtube software.

Though, advanced software structure and security has not been tested out . Such as if a hacker tries to hack the software and take user's personal information and browsing history by attack Youtube using several login or server method.

From the test, the overall core functionality of Youtube has works fine , but I would suggest Youtube enables user to customize the layout visual of each tab to better suit individual preferences and improve flexibility.

I have not found any bugs in the software testing.
